

## Prompts

1. What is CSS clearfix, how is it used, and why is it helpful?

Fixes a bug when using the float method is used for two elements stacked next to each other, where they will default to a zero height value and make them overlap and have other problems.

2. What are SaSS and LESS? They both Css extensions that improve the functionality of CSS. LESS is JavaScript based and can be accessed, after installing it on your computer, by adding 's' to the css extension, making it .scss.

SaSS is based on Ruby Markup Extension and must be installed locally on your computer

3. What is your favorite thing you learned this week?

Learning CSS is an amazing leap forward from looking at script in a console! Being able to manipulate the html page seems like a very efficient way to get work done. You can basically dump text and images onto a page and walk through and create a style sheet to arrange it and make it function however you want it to. I hope to master this and get involved in the leading edge development of amazing new styles that everyone uses to make incredible web pages.
